Semester Project 1 Proposal

Name: SHUBHAM

UNI: SL5836

Repository: funnystudy

User problem / opportunity: Participants move through multiple steps before they can begin a study: sign in, answer notification questions, complete demographics, fill out profile details, and then start a study. The experience is functional, but it can still feel unclear and fragmented. Users may not easily know what is complete, what is still pending, or how to resume a study after a break. This creates confusion and can reduce completion rates.

Who benefits: Study participants, researchers and study administrators, and product team / PMs tracking completion flow.

Improvement proposed: Add a clearer study progress and resume experience to the funnystudy app. The improvement would include visible status summaries for onboarding and study progress, clearer “In progress” / “Completed” labels, a more obvious “Resume study” / “Continue study” action, and a completion summary after finishing a study.

Why this would help: This would reduce participant confusion and make the process feel more intentional and trustworthy. It would also help users recover from interruptions without losing context. A clearer flow should lead to better completion and a smoother experience for participants and admins alike.

Expected outcome: By the end of the semester, I expect to demonstrate an improved participant home experience, a more reliable resume/continue flow, stronger completion-state messaging, and an overall smoother onboarding and study journey.

PM approval status: Proposal submitted for PM review. This is a focused, user-centered UX improvement that fits the existing project scope and can be completed within the semester without requiring a major system overhaul.
